Burnout Insight - Repository Guide

A simple guide to the purpose, features, structure, scoring, privacy, and development workflow of the Burnout Insight website.

1. Project purpose

Burnout Insight is a standalone English website for educational reflection on exhaustion and workplace pressure. It runs in a browser and does not require an account, server, or database.

The project helps a person understand patterns in personal and work-related exhaustion and provides practical, non-clinical suggestions for workplace concerns and recovery.

The site is not a medical diagnostic tool.

2. What the tool can do

- Ask 25 mixed questions: 13 CBI exhaustion questions and 12 workplace questions.

- Update Personal burnout and Work-related burnout meters during the assessment.

- Use Enter to submit a selected answer and move to the next question.

- Show lower, elevated, and higher ranges with matching colors.

- Provide Immediate support check-ins for workload, control, coworker tension, or exhaustion.

- Save complete reports and all question/answer details in browser records.

Review, delete, restore, and export saved reports.

- Create a formatted report that can be saved as a real PDF from the browser print dialog.

- Provide a private seven-day progress plan.

3. Main user flow

- Choose Find my pattern for the full assessment, or Get immediate help for a focused check-in.

- Answer each question. Select an option and press Enter, or click Continue.

- Review the colored meters, explanations, and suggested next steps.

- Open Records to review saved reports and select Create PDF report.

- Choose Save as PDF in the browser print dialog.

4. Repository structure

- website/index.html - generated standalone browser file.

- website/app.js - pages, survey flow, meters, records, reports, exports, and interactions.

- website/core.js - questions, answer scales, scoring rules, and sources.

- website/style.css - layout, colors, responsive design, and print styling.

- website/build.py - combines the source files into index.html.

docs/Burnout_Insight_Repository_Guide.md - source version of this guide.

docs/Burnout_Insight_Repository_Guide.pdf - PDF version of this guide.

5. Scoring design

- CBI answer choices become 100, 75, 50, 25, or 0.

- The personal score averages P01-P06.

- The work-related CBI score averages W01-W07. W07 is reverse-scored because it asks about energy during leisure time.

- The 12 workplace questions cover Workload, Control, Reward, Community, Fairness, and Values.

- Severity bands are Lower below 34, Elevated from 34 through 66, and Higher at 67 or above. These are presentation bands, not clinical cutoffs.

6. Records, privacy, and reports

- Records stay in browser local storage. No account or server upload is required.

- Saved reports include scores, workplace analysis, recommendations, report date/time, and response details.

- PDF export uses the browser print dialog because a standalone page cannot silently create a valid PDF without a PDF library or server.

- Browser storage can be cleared, and reports may contain sensitive personal reflections.

7. Development workflow

- After editing app.js, core.js, or style.css, run: python website/build.py

- Run scoring tests: node Burnout_Insight_ALL_IN_ONE/tests/scoring.test.cjs

- Check JavaScript syntax: node --check website/app.js

- Synchronize the generated index.html before publishing.

8. Important limitation

- Burnout Insight is an educational reflection tool. It cannot determine whether a person has burnout or another health condition and should not replace qualified professional support.
